

# Practical 7 : Implementing AODV

Aim: Implementing AODV

Objective:

To simulate and analyze the Link State (LS) Dynamic Routing Protocol using NS-2 and verify route

Topology & Traffic Configuration:

- Simulator: NS-2.35 | Animator: NAM
  - Nodes: 12 nodes (0 to 11) arranged with alternate multi-hop links
  - Traffic Flows:
    - o Flow 0 (Red): Node 0 → Node 5 (UDP/CBR)
    - o Flow 1 (Green): Node 1 → Node 5 (UDP/CBR)
  - Dynamic Events:
    - o 10.0s: Link (11-5) goes DOWN → Reroutes via alternate path
    - o 15.0s: Link (7-6) goes DOWN
    - o 20.0s: Link (7-6) comes UP
    - o 30.0s: Link (11-5) comes UP → Re-converges back to direct link
- Output:
